An opto-isolator is an electronic component that transfers electrical signals between two isolated circuits by using light. Opto-isolators prevent high voltages from affecting the system receiving the signal. Commercially available opto-isolators withstand input-to-output voltages up to 10 kV and voltage transients with speeds up to 25 kV / μ s. A common type of opto-isolator consists of an LED and a phototransistor in the same opaque package. Other types of source-sensor combinations include ...

Opto-electrical isolation of the I2C-Bus. October 14, 2004 Embedded Staff. The I2 C-bus is fabulously popular and successful as a low-cost way to attach chips together in small embedded systems. In some systems, though, these chips need to be opto-isolated to avoid damage from stray electrical current in harsh environments.

An opto-isolator is a component that transfers electrical signals between two isolated circuits by using light. This allows transmission of electrical signals between systems of different voltages with complete electrical isolation up to the rated isolation voltage. A 5 V logic signal, for example, might switch a mains circuit using an opto-isolator without risk of the mains feeding into to the low-voltage logic. 1 kV isolation is common for mains powered circuits.

Opto click 2 can be used in applications where the input side is under risk of high voltage surges in a noisy environment. Since it provides a galvanic isolation, the electrical potential of the input side circuit does not have to be the same as the electrical potential of the MCU circuit. Featuring the galvanic isolation, Opto click 2 blocks so-

Galvanic isolation is a principle of isolating functional sections of electrical systems to prevent current flow; no direct conduction path is permitted. [1] [2] Energy or information can still be exchanged between the sections by other means, such as capacitance , induction or electromagnetic waves, or by optical, acoustic or mechanical means.

Galvanic isolation - Wikipedia

An optoisolator is an electronics device that transfers electrical energy from one circuit to another through a short optical transmission path while providing electrical isolation between two circuits. An optoisolator couples high voltages from one side of the circuit to the other without any direct electrical contact.
