Ecologists study the living components of the biosphere in subunits called biomes. A biome is a group of communities with stable ecosystems dominated by a particular climax community. Deserts, forests, and prairies are examples of biomes. Other examples are the tundra, taiga (the southern edge of the tundra), and temperate forests. Each biome represents a unique situation where the ecosystem is defined by the environment.

A factor that is non-living or has never lived 3) Give three examples of biotic factors. Grass, dog, cat 4) Give three examples of abiotic factors. Sun, air, temperature 5) List and describe the five levels of environmental organization. • Biosphere: all ecosystems working together; the earth • Ecosystem: communities and their abiotic factors • Community: multiple populations of species • Population: a group of the same species • Organism: one individual 6) What is a producer?

~~Ecology Study Guide Answers~~

The enclosed biome in Biosphere 2 allows scientists to control the environment in ways not possible in natural rainforests. With the ability to change such factors as humidity and temperature, the researchers can better understand the impacts of climate change on tropical rainforests, which play a vital role in the planet 's health by absorbing carbon dioxide and releasing oxygen.

~~Biosphere Study Guide—Kora~~

The biosphere extends into the atmosphere (several kilometers above Earth) and into the depths of the oceans. Despite its apparent vastness to an individual human, the biosphere occupies only a minute space when compared to the known universe. Many abiotic forces influence where life can exist and the types of organisms found in the biosphere.
