### Connectivity Configuration Guide ...

Enabling IPv6 on Cisco IOS Software Technology The first step of enabling IPv6 on a Cisco router is the activation of IPv6 traffic forwarding to forward unicast IPv6 packets between network interfaces. By default, IPv6 traffic forwarding is disabled on Cisco routers.

### *Configuring IPv6 on Cisco IOS Software > Cisco Self-Study ...*

You must enable routing by using the ip routing global configuration command, enable the forwarding of IPv6 packets by using the ipv6 unicast-routing command in global configuration mode, and enable IPv6 on at least one Layer 3 interface by configuring an IPv6 address on the interface.

Before configuring the device with a static IPv6 route, you must enable the forwarding of IPv6 packets using the `ipv6 unicast-routing` global configuration command, enable IPv6 on at least one interface, and configure an IPv6 address on that interface. required to configure IPv6 addresses and the associated parameters on the Cisco IOS, and also enables one to effectively configure IPv6 on its own network or on a customer's network. Ethernet works on how the router actually routes the packet. The major differences are in the syntax used to enter the address.
