Electricity, simply put, is the flow of

electric current along a conductor. This

electric current takes the form of free

electrons that transfer from one atom to

the next. Thus, the more free electrons a

material has, the better it conducts. There

Protons are positively charged and neutrons (as the name suggests) have no electrical charge. Electrons are negatively charged and they circle around the nucleus. The negatively charged electron is held in place by the positive charge of the proton. This is because unlike poles (or opposites) attract and like poles repel.
