Valve Timing Diagram. The above processes will be operated with the sequence of operations of the valves in the Four-stroke engine. This relation between the valve opening timings to the piston moves from the Top Dead Centre (TDC) to the Bottom Dead Centre (BDC) can be represented on a circle. This is called the Valve Timing Diagram.

A valve timing diagram is a graphical representation of the opening and closing of the intake and exhaust valve of the engine, The opening and closing of the valves of the engine depend upon the movement of piston from TDC to BDC, This relation between piston and valves is controlled by setting a graphical representation between these two, which is known as valve timing diagram. The valve timing diagram comprises of a 360 degree figure which represents the movement of the piston from TDC to ...

7 Theoretical valve timing diagram for four stroke cycle engine •
Now the piston reaches BDC and then starts moving up, thus performing the exhaust stroke. The inlet valve opens before the piston reaches TDC to start suction stroke. This is done as the fresh incoming charge helps in pushing out the burnt gases. Now the piston again reaches TDC, and the suction stroke starts.

Internal combustion engines Camshaft. In four-stroke cycle engines and some two-stroke cycle engines, the valve timing is controlled by the camshaft. It can be varied by modifying the camshaft, or it can be varied during engine operation by variable valve timing. It is also affected by the adjustment of the valve mechanism, and particularly by the tappet clearance.

Valve timing diagram shows the opening and closing of inlet and exhaust valve according to the 4 strokes of engines or we can simply say according to the two revolution of crankshaft. It is clearly shown in the diagram that inlet valve opens 25 degree before TDC (Top dead center - top edge of the cylinder) and inlet valve closes after suction stage ends i.e 30 degree after BDC.
